ABSTRACT

STORAGE OF PROJECTED PRESENTATIONS

[0039] A method and system for capturing real-time digital image data that is in rasterized form. A digital source sends rasterized data to a storage device, which passes the rasterized data to a display device. The rasterized data is then converted into a page format, such as PowerPoint™ formatted slides, based on changes in the rasterized data. If the data changes quickly enough, the storage device converts the rasterized data into a motion picture format. Otherwise, the rasterized data is stored as a single page static image.
